

# **NEPC PENSION MONITOR**

**JANUARY 2024** 

In January, pension plan sponsors experienced higher liability discount rates as interest rates increased. During this period, global public equities posted modest gains, while the Treasury yield curve rose across most tenors. Total-return-focused plans likely experienced positive changes in funded status due to higher discount rates combined with positive equity market performance. NEPC's hypothetical total-return pension plan experienced an improvement of 2.0% in funded status compared to an increase of 0.6% for the LDI-focused plan.

## **RATE MOVEMENT COMMENTARY**

The Treasury yield curve increased slightly in January, and remained inverted from the one- to five-year tenors. The five-year yield rose seven basis points to 3.91%, while the 30-year yield increased 19 basis points to 4.22%. Rates across the yield curve have risen since last year.

The movement in Treasury rates and credit spreads resulted in higher pension discount rates used to discount pension liabilities. The discount rates for NEPC's hypothetical pension plans increased about 15 basis points to 5.20% for the open total-return plan, while the discount rate for the frozen LDI-focused plan rose around 13 basis points to 5.11%.

The Buyout Index for retirees is estimated to be approximately 103.1% of PBO, as of January 31, 2024

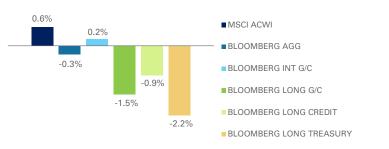

# **NEPC PENSION MONITOR**

**JANUARY 2024** 

## PLAN SPONSOR CONSIDERATIONS

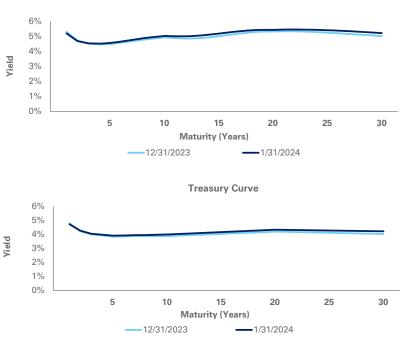

Global public equities posted marginal gains in January, and long-dated fixed-income debt posted losses fueled by higher Treasury rates. Treasury yields increased in January with the yield curve shifting higher. A modest contraction in longer-maturity credit spreads detracted from potential increases in liability discount rates used for valuing pension liabilities. At NEPC, we anticipate continued market volatility and the potential for market disruption. Plan sponsors should remain diligent about monitoring sources of change in funded status versus expectations, as equities and interest rates are likely to remain volatile. This includes closely monitoring ranges of hedge ratios to avoid becoming overhedged to longer-maturity rates with a flatter yield curve.

## MARKET ENVIRONMENT AND YIELD CURVE MOVEMENT

In January, U.S. equities gained 1.7%, according to the S&P 500 Index. During the same period, non-U.S. equities also experienced gains with international developed markets returning 0.6%, according to the MSCI EAFE Index. Emerging market equities detracted from global public equity returns and were down 4.6% last month, according to the MSCI EM Index. Broadly, global equities rose 0.6% during the same period, according to the MSCI ACWI Index.

In January, the Treasury curve rose modestly from the previous month and remained inverted from the one- to five-year tenors. This generally resulted in losses for longer-maturity fixed-income markets, with long-credit fixed income experiencing somewhat lower losses compared to long Treasuries. During the month, the Bloomberg Long Treasury Index decreased 2.2% and the Bloomberg Long Credit Index fell 0.9%.

**FTSE Above Median AA Pension Curve** 

#### DISCLOSURES

Liability returns are based on the FTSE Above Median Pension Discount Curve. Liabilities for the two hypothetical plans are based on sample benefit payments of two unique plans. The total-return plan reflects an open plan with a 14.5-year duration, while the LDI-focused plan represents a frozen plan with a 9.5-year duration as of December 31, 2023. The benefit payments are not rolled forward each month to maintain a stable demographic profile. No future benefit accruals or benefit payments are assumed in order to isolate the performance of plan's liabilities due to changes in interest rates. The funded status of each hypothetical plan was reset to 80% funded (Total-Return) and 100% funded (LDI-focused) as of December 31, 2023.

The total-return plan assumes an allocation of 60% global equity, 40% core bonds. The LDI-focused plan assumes an asset allocation of 30% global equity and 70% US IG credit and Treasuries constructed to match the beginning of year 90% hedge ratio, with a greater emphasis on hedging liability duration. Monthly rebalancing is assumed. We do not assume any fees, expenses, benefit payments or contributions are made during the year in order to isolate the impact of market returns on the hypothetical allocations.

NEPC's Retiree Buyout Index is estimated using midpoint annuity purchase rates published by Brentwood Advisors, discounted against the cash flows of a sample retiree population, and compared with the same discounted cashflows using the FTSE Above Median Pension Discount Curve. Actual annuity pricing may vary substantially based on multiple factors.
